Report Overview

Gas chromatography tandem mass spectrometer is an instrument that combines the characteristics of gas chromatography and mass spectrometry for analysis. Using gas chromatography and mass spectrometry together is much more precise in identifying and quantifying substances than using that part alone. times. It is impossible to accurately identify a specific molecule using gas chromatography or mass spectrometry alone. But usually, mass spectrometer processing requires very pure samples, and gas chromatography using traditional detectors cannot distinguish between multiple molecules when they pass through the column at the same time, which will cause two or more molecules to pass through the column at the same time. flow out of the column. Similar patterns of ionized fragments also appear when the mass spectrometer detector is used alone. Combining these two methods reduces the possibility of error because it is very rare for two molecules to have the same chromatographic and mass spectrometric behavior
