Abstracts

Gas Cluster Ion Source (GCIS) is a device for producing gas cluster ion beams, which is widely used in the field of material surface analysis and modification. It mainly consists of a cluster forming chamber and an ionization chamber. In cluster-forming chambers, high-pressure gases (such as argon, nitrogen, carbon dioxide, etc.) enter the vacuum environment through a nozzle, rapidly cool and condense into neutral clusters due to adiabatic expansion. These neutral clusters then enter the ionization chamber and are converted into charged cluster ions by electron bombardment or other means of ionization. After the cluster ions are accelerated and focused, the cluster ion beams with certain energy and beam intensity are formed for the analysis and treatment of the sample surface. Gas cluster ion source has the characteristics of low damage and high efficiency, which is suitable for surface analysis and modification of organic materials, biological samples and other materials.

The global Gas Cluster Ion Source market size was estimated at USD 1839.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 14.60% during the forecast period.
