Abstracts

A gas cogeneration system, also known as a combined heat and power (CHP) system, is an energy-efficient technology that simultaneously generates electricity and useful thermal energy?such as steam or hot water?from a single fuel source, typically natural gas or biogas, by capturing and utilizing waste heat that would otherwise be lost in conventional power generation. These systems operate through a prime mover, such as a gas turbine, reciprocating engine, or fuel cell, which drives an electrical generator while the exhaust heat is recovered for heating, cooling, or industrial processes, resulting in significantly higher overall efficiency?often exceeding 80%?compared to separate generation of heat and power. By reducing energy waste, lowering greenhouse gas emissions, and providing on-site power resilience, gas cogeneration systems serve as a decentralized energy solution for commercial, industrial, institutional, and multi-unit residential applications seeking to optimize energy costs, enhance sustainability, and ensure operational reliability.

The global Gas Cogeneration System market size was estimated at USD 1025.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.75% during the forecast period.
