Report Overview

Gas diffusion electrode (GDE) is a special type of electrode that typically consists of a gas diffusion layer, an electrode catalyst layer, and an electrode support layer. Its main function is to convert gaseous reactants (such as hydrogen, oxygen, etc.) into electrical current for electrochemical energy conversion or electrochemical reaction studies. The gas diffusion layer is responsible for evenly distributing the gas to the electrode catalyst layer, while the electrode catalyst layer is the main reaction region of the gas diffusion electrode, typically employing noble metal or non-noble metal catalysts. The electrode support layer provides mechanical stability, conductivity, and channels for transporting reaction products. Gas diffusion electrodes are widely used in electrochemical fields such as fuel cells and hydrogen production by water electrolysis.

The global Gas Diffusion Electrode (Gde) market size was estimated at USD 450.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
