Abstracts

Gas Diffusion Layer (GDL) carbon paper is a porous material used in fuel cells and electrolyzers. It provides a pathway for reactant gases (hydrogen and oxygen or air) to reach the catalyst layer and for product water to be removed. It's typically made from carbon fibers bonded together with a binder, creating a structure with high electrical conductivity, porosity, and permeability. The GDL also provides mechanical support to the catalyst layer and helps manage water transport within the cell. The industry trend for Gas Diffusion Layer (GDL) carbon paper is focused on improving performance, durability, and cost-effectiveness for fuel cell and electrolyzer applications. Key trends include optimizing the microstructure of the carbon paper, such as porosity, pore size distribution, and fiber orientation, to enhance gas transport and water management. Researchers are exploring new materials and manufacturing processes to improve electrical conductivity, corrosion resistance, and mechanical strength. There's a strong emphasis on developing GDLs with improved water management capabilities to prevent flooding or drying of the catalyst layer, which can significantly impact performance and durability. This includes exploring hydrophobic or hydrophilic coatings and surface treatments. Cost reduction is a major driver, with efforts to develop lower-cost materials and manufacturing processes. There's also a growing interest in using sustainable materials and manufacturing processes to reduce the environmental impact of GDL production. Furthermore, the industry is exploring novel GDL architectures, such as multi-layer structures and gradient porosity designs, to further enhance performance and tailor GDL properties for specific applications.

The global Gas Diffusion Layer Carbon Paper market size was estimated at USD 161.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 22.10% during the forecast period.
