## Abstracts

Gas Diffusion Layer (GDL) titanium felt is a porous material made of interwoven titanium fibers. It is used in electrochemical devices, particularly proton exchange membrane (PEM) electrolyzers and fuel cells, especially in harsh operating conditions. Its primary functions are similar to carbon paper GDLs: facilitating gas transport to the catalyst layer, removing product water, and providing electrical conductivity. Titanium's excellent corrosion resistance, especially in acidic environments, makes it suitable for applications where carbon-based GDLs may degrade. The industry trend for Gas Diffusion Layer (GDL) titanium felt is driven by the need for more durable and efficient electrochemical devices, particularly for hydrogen production via PEM electrolysis. Key trends include optimizing the porosity and permeability of the titanium felt to improve gas transport and water management. Researchers are exploring different fiber diameters, weaving patterns, and sintering techniques to achieve desired microstructures. Surface modification of the titanium felt, such as coatings or functionalization, is also being investigated to enhance corrosion resistance, improve electrical conductivity, and promote better contact with the catalyst layer. Cost reduction is a significant focus, as titanium is more expensive than carbon. This involves exploring new manufacturing processes and potentially using lower-cost titanium alloys or composite materials. Furthermore, there is a growing interest in developing titanium felt GDLs with improved mechanical properties to withstand the stresses and strains experienced in operating electrolyzers and fuel cells. The industry is also exploring novel GDL architectures, such as incorporating other materials or creating gradient porosity structures, to further enhance performance and tailor GDL properties for specific operating conditions. The overall goal is to achieve high efficiency, long-term stability, and cost-effectiveness for large-scale hydrogen production using PEM electrolysis.

The global Gas Diffusion Layer Titanium Felt market size was estimated at USD 142.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.90% during the forecast period.
