### Report Overview

Gas discharge bulbs, also known as gas-discharge lamps, are a type of lighting technology that produces light by passing an electric current through an ionized gas or plasma, typically enclosed in a glass or quartz tube. These bulbs operate on the principle of gas ionization, where the excited gas atoms emit photons as they return to their ground state, creating visible light. Common types include high-intensity discharge (HID) lamps such as metal halide, sodium vapor, and mercury vapor bulbs, as well as neon and fluorescent tubes. They are known for their high efficiency, long lifespan, and bright illumination, making them suitable for applications like street lighting, industrial facilities, automotive headlights, and commercial signage. However, they often require ballasts to regulate current flow and may have limitations in color rendering compared to LED alternatives. The market for gas discharge bulbs has faced increasing competition from LED technology due to its superior energy efficiency and declining costs, though niche applications still sustain demand for gas-discharge solutions.

The global Gas Discharge Bulbs market size was estimated at USD 200.22 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 2.50% during the forecast period.
