Abstracts

This report focusses on Gas Dynamic Cold Spray Equipment market. Cold Spray (CS) (formerly gas dynamic cold spray) is a coating deposition method. Solid powders (1 to 50 micrometers in diameter) are accelerated in a supersonic gas jet to velocities up to 500-1000 m/s. During impact with the substrate, particles undergo plastic deformation and adhere to the surface. To achieve a uniform thickness the spraying nozzle is scanned along the substrate. Metals, polymers, ceramics, composite materials and nanocrystalline powders can be deposited using cold spraying. The kinetic energy of the particles, supplied by the expansion of the gas, is converted to plastic deformation energy during bonding. Unlike thermal spraying techniques, e.g., plasma spraying, arc spraying, flame spraying, or high velocity oxygen fuel (HVOF), the powders are not melted during the spraying process. Cold spray has been applied to numerous high strength aluminum parts, but it has also been used to deposit stainless steel and other high strength steels, bronze alloys, nickel alloys, titanium, and even exotic elements like tantalum and niobium. Cold spray doesn't fix everything, but it has the ability to solve challenges that other technologies simply can't touch. And just as importantly, once a cold spray process has been developed, it can be applied reliably and repeatedly for a given application. VRC Metal Systems ranked first in the global Gas Dynamic Cold Spray Equipment Market share, with a share of 35%. Top 3 companies account for almost 70% of the total share, and the whole market is centralized.
