## Abstracts

A Gas Engine Heat Pump (GHP) is a highly efficient heating and cooling system that utilizes natural gas or propane to power an internal combustion engine, which in turn drives a vapor-compression cycle to transfer heat between indoor and outdoor environments. Unlike conventional electric heat pumps, GHPs leverage the engine's waste heat for supplementary heating, significantly boosting overall efficiency, particularly in colder climates where electric heat pumps often suffer from reduced performance. This dual-energy approach?gas for the engine and electricity only for auxiliary components?makes GHPs an attractive option for commercial, industrial, and larger residential applications where energy cost savings, reliability, and reduced peak electrical demand are prioritized.

The global Gas Engine Heat Pump (Ghp) market size was estimated at USD 925.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
