Abstracts

A gas-fired Combined Cooling, Heating, and Power (CCHP) system, also known as trigeneration, is an energy-efficient system that simultaneously produces electricity, heating, and cooling from a single fuel source—typically natural gas. At its core, a gas turbine or engine generates electricity, and the waste heat from this process is captured to provide heating (e.g., hot water or steam). This thermal energy can also be used in absorption chillers to produce cooling for air conditioning. By utilizing the waste heat that would otherwise be lost in conventional power generation, CCHP systems significantly improve overall energy efficiency, reduce fuel consumption, and lower greenhouse gas emissions, making them ideal for commercial buildings, hospitals, campuses, and industrial facilities with continuous thermal and electrical loads.

The global Gas-fired Combined Cooling Heating and Power System market size was estimated at USD 152.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
