## Abstracts

The working principle of Gas-Liquid Membrane Contactor is to use a porous membrane to separate the gas and liquid phases, but allow certain substances to be transferred through the membrane pores. On one side of the membrane, substances in the gas phase (such as gas molecules, steam, etc.) enter the membrane pores through diffusion, and then contact and react with the liquid phase on the other side of the membrane. Depending on the specific application scenario, this contact and reaction can achieve processes such as absorption, desorption, extraction or distillation of substances.

The global Gas-Liquid Membrane Contactor market size was estimated at USD 432.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
