### Report Overview

Gas-phase-grown carbon fiber is manufactured through the catalytic decomposition of hydrocarbons such as methane and benzene in the vapour phase. These fibers contain circular cross sections and central hollow cores that have a few nanometre diameters. The graphite networks are organized in concentric cylinders and carbon fibers are placed like tree rings to form a unique structure that has outstanding physical properties. High tensile strength and tensile modulus, low electrical resistivity, and high thermal conductivity are some of the properties that make these fibers ideal for industrial applications. Their thermal conductivity (1,950 W/m-K) is the highest among all commercial carbon fibers available in the market. These fibers are anticipated to deliver a new generation of polymer composites that have multifunctional properties.
