### Report Overview

Gas Pressure Spring is a type of spring that, unlike a typical mechanical spring that relies on elastic deformation, uses compressed gas contained within an enclosed cylinder sealed by a sliding piston to pneumatically store potential energy and withstand external force applied parallel to the direction of the piston shaft. Common applications include automobiles (where they are incorporated into the design of struts that support the weight of the hatchback tailgate while they are open) and office chairs. They are also used in furniture, medical and aerospace applications. Much larger gas springs are found in machines that are used in industrial manufacturing (the press tooling industry), where the forces they are required to exert often range from 2500N to 400,000N (forty tonnes).

The global Gas Pressure Springs market size was estimated at USD 1175 million in 2023 and is projected to reach USD 1918.73 million by 2032, exhibiting a CAGR of 5.60% during the forecast period.

North America Gas Pressure Springs market size was estimated at USD 336.27 million in 2023, at a CAGR of 4.80% during the forecast period of 2024 through 2032.
