Abstracts

Gas proportional detectors can be adapted to detect neutrons. While neutrons do not typically cause ionization, the addition of a nuclide with high neutron cross-section allows the detector to respond to neutrons. Nuclides commonly used for this purpose are helium-3, lithium-6, boron-10 and uranium-235. Since these materials are most likely to react with thermal neutrons (i.e., neutrons that have slowed to equilibrium with their surroundings), they are typically surrounded by moderating materials to reduce their energy and increase the likelihood of detection. Gas proportional detectors, as a crucial component in the realm of safety monitoring, are garnering increasing attention on a global scale. With the continuous advancement of industrialization, issues related to gas emissions and leaks in upstream industries have become more pronounced. This intensifies the demand for the application of gas proportional detectors within production environments. Simultaneously, downstream markets are showing heightened concern for workplace safety, leading to growing needs across various sectors to prevent and monitor problems like gas leaks and abnormal concentrations. Therefore, gas proportional detectors, serving as a pivotal link between upstream and downstream, are poised for steady growth in the future. With ongoing technological progress, these detectors are expected to become more precise, sensitive, and easily integrable into diverse work environments, catering to a range of diverse needs.

The global Gas Proportional Detector market size was estimated at USD 394.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
