Report Overview:

Gas Separation Membranes is an interphase between two adjacent phases acting as a selective barrier, regulating the transport of gases among gas mixtures. Gas separation across a membrane is a pressure-driven process, where the driving force is the difference in pressure between inlet of raw material and outlet of product. The membrane used in the process is a generally non-porous layer, so there will not be a severe leakage of gas through the membrane. Gas separation membranes work according to the principle of selective permeation through the membrane surface. The permeation rate of each gas depends on its solubility in the membrane material and on the diffusion rate of the gas. Gases with high solubility and small molecules pass through the membrane very quickly.

The Global Gas Separation Membranes Market Size was estimated at USD 657.15 million in 2023 and is projected to reach USD 880.65 million by 2029, exhibiting a CAGR of 5.00% during the forecast period.
