Abstracts

Gas Shielded Flux Cored Welding Wire is a type of welding consumable used in the process of flux-cored arc welding. It consists of a metal wire with a flux core that helps to protect the weld pool from contaminants in the air. The wire is fed through a welding gun, where an inert gas, such as carbon dioxide (CO₂) or a mixture of CO₂ and argon, is supplied to shield the weld area from atmospheric gases, particularly oxygen and nitrogen. This shielding prevents defects such as oxidation or porosity in the weld. The flux inside the wire melts during the welding process, releasing gases and creating a protective slag that covers the molten weld pool. This slag protects the weld from contamination as it cools, ensuring high-quality and strong welds.

The global Gas Shielded Flux Cored Welding Wire market size was estimated at USD 316.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
