Report Overview

The gallium wafers are made from several constituents such as silicon, n-type gallium phosphate or n-type gallium nitride. Silicon wafers are manufactured by using thin-film deposition method and gallium nitride wafers are manufactured through roll-to-roll process. In both types, the wafer material is deposited with certain gallium nitride or silica flakes. The Gallium Antimonide Wafers Applications has evolved to include the most up-to-date technology with the use of highly advanced technologies like infrared detectors, lasers, thermocouple sensors and many others. It is also equipped with several software applications including the Automatic Identification Function System (AIFS) and the Automatic Identification System (AIS). The main features of gallium antimonide wafers are its broad absorption spectrum that enables the detectors to easily detect even a single molecule and its wide frequency response that enables it to be used for different applications. It also has the best possible energy efficiency, the lowest power consumption and the highest sensitivity.
