Abstracts

A gasoline plate compactor is a heavy-duty construction equipment powered by an internal combustion engine, designed to compact various types of soil, gravel, asphalt, and other granular materials by transmitting high-frequency vibrations through a large, flat base plate. It is commonly used in construction, landscaping, and roadwork projects to increase soil density, improve stability, reduce settling, and create a solid foundation for structures or pavement. Unlike electric or hydraulic models, gasoline-powered compactors offer greater mobility and are ideal for remote or large-scale job sites where access to electricity is limited. Key components include the engine, centrifugal clutch, exciter mechanism, base plate, and handlebars for operator control, with performance often measured by impact force, amplitude, and frequency to suit different material types and compaction requirements.

The global Gasoline Plate Compactor market size was estimated at USD 345.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
