Report Overview

Gastroesophageal reflux disease or GERD is a set of conditions, where the lower esophageal sphincter (LES) is affected when the contents of the stomach flows back to the esophagus. In usual digestion process, the lower esophageal sphincter unfastens to let food to pass into stomach and shuts to prevent acidic stomach juices and food from going back into the esophagus. Gastroesophageal reflux takes place when the lower esophageal sphincter relaxes inappropriately or is weak, thereby allowing the contents of the stomach to flow up into the esophagus. Many doctors believe that hiatal hernia may wane the lower esophageal sphincter and augment the risk for gastroesophageal reflux.
