Report Overview

Gastrointestinal (GI) stents are medical devices designed to maintain or restore the patency of narrowed or obstructed sections within the gastrointestinal tract, including the esophagus, stomach, duodenum, colon, and biliary system. These stents are typically made of metallic or polymer materials, often self-expanding, and are deployed endoscopically or under fluoroscopic guidance to relieve obstructions caused by malignancies, strictures, or other pathological conditions. The market for GI stents is driven by the rising prevalence of gastrointestinal cancers, such as esophageal and colorectal cancer, as well as benign conditions like strictures and fistulas. Additionally, advancements in stent design, including drug-eluting and biodegradable stents, are enhancing efficacy and reducing complications like migration or tissue hyperplasia. The market is segmented by product type (esophageal, biliary, duodenal, and colonic stents), material (metal, plastic, and biodegradable), and end-user (hospitals, ambulatory surgical centers, and specialty clinics). Key players focus on innovation, regulatory approvals, and strategic collaborations to expand their market presence, while reimbursement policies and high device costs remain notable challenges. Geographically, North America and Europe dominate due to advanced healthcare infrastructure, whereas Asia-Pacific is witnessing rapid growth due to increasing healthcare expenditure and rising disease burden.

The global Gastrointestinal GI Stents market size was estimated at USD 352.51 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.84% during the forecast period.
