Report Overview

The gastrostomy feeding tube (G-tube) is a medical device inserted through the abdomen into the stomach to provide nutrition, hydration, or medication to patients who cannot consume food orally due to conditions such as dysphagia, neurological disorders, cancer, or severe gastrointestinal impairments. These tubes are typically made of silicone or polyurethane, designed for long-term use, and may include features like low-profile buttons for improved comfort or anti-reflux valves to prevent aspiration. G-tubes serve as a critical lifeline for both pediatric and adult populations, ensuring adequate nutritional support while minimizing complications associated with prolonged intravenous feeding or nasogastric tubes. The market for these devices is driven by rising incidences of chronic illnesses, aging populations, and advancements in minimally invasive placement techniques, though it remains highly regulated due to infection risks and the need for precise clinical indications.
