Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Gate-Controlled Thyristors (GCTs) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, Global gate-controlled thyristors (GCTs) produced about 5.2 million units with 6.3 million units of capacity, the average unit price is about \$95, and averaging a 34% gross margin. Gate-controlled thyristors (GCTs) are high-power semiconductor switching devices that combine the rugged current-handling capability of conventional thyristors with improved turn-off controllability via a dedicated gate structure, enabling fast, reliable switching in medium- to high-voltage applications such as HVDC transmission, traction drives, industrial motor control, and static VAR compensators. Their supply chain begins with upstream electronic-grade silicon ingots and wafers, dopants, diffusion/ion-implant materials, and metallization pastes; moves into midstream device fabrication steps including wafer thinning, epitaxy, photolithography, diffusion, passivation, and gate-structure formation; followed by module assembly involving die attach, ceramic isolation substrates (Al₂O₃/AlN), copper baseplates, bond wires, encapsulation, and thermal interface materials; and ends downstream with system-level integration by power electronics manufacturers who integrate GCT modules into converters, inverters, traction systems, and grid equipment.

The global Gate-Controlled Thyristors (GCTs) market size was estimated at USD 485.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
