Abstracts

A Gdh Fad blood glucose meter is a medical device designed for the quantitative measurement of glucose levels in whole blood, utilizing the glucose dehydrogenase flavin adenine dinucleotide (GDH-FAD) enzyme-based methodology. This electrochemical technology provides an alternative to traditional glucose oxidase-based systems, offering enhanced specificity by minimizing interference from substances like oxygen and certain medications, though it remains susceptible to inaccuracies when maltose, galactose, or xylose are present in the blood. These meters are primarily used by individuals with diabetes for self-monitoring of blood glucose (SMBG), enabling real-time tracking of glycemic control to support daily management decisions such as insulin dosing, dietary adjustments, and physical activity planning. The device typically consists of a handheld meter and compatible test strips containing the GDH-FAD enzyme, with operation involving the application of a small blood sample to the strip, which generates an electrical current proportional to the glucose concentration, displayed digitally on the meter within seconds.

The global Gdh Fad Blood Glucose Meter market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
