Abstracts

Gearbox sliding bearings, also known as plain bearings or bushings, are machine elements designed to support rotational or linear movement between components within a gearbox while minimizing friction and wear. These components operate without rolling elements, relying instead on a sliding motion between surfaces, often with the aid of lubricants to reduce heat and prolong service life. They are typically made from materials such as bronze, bimetallic composites, or polymers engineered for durability, load capacity, and compatibility with specific operational environments. Their primary function is to maintain precise alignment, absorb radial or axial loads, and ensure smooth power transmission in gear-driven systems across industries like automotive, industrial machinery, wind energy, and heavy equipment.

The global Gearbox Sliding Bearings market size was estimated at USD 285.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.15% during the forecast period.
