Report Overview

The gearless synchronous traction machine is a mechanical transmission device used to transmit power to the traction rope or chain to realize the lifting or transportation of objects. Compared with traditional gear transmission, the gearless synchronous traction machine adopts the principle of gearless transmission and realizes transmission through friction and tension, which has higher efficiency and precision. Gearless synchronous traction machines usually consist of motors, reducers, synchronous wheels, traction ropes or chains, etc. The motor reduces the speed through the reducer, and contacts the traction rope or chain through the synchronous wheel to transmit power through friction and tension. The traction rope or chain is fixed on the object. When the motor rotates, the traction rope or chain will be pulled, thereby lifting or transporting the object.

The global Gearless Synchronous Traction Machine market size was estimated at USD 1245.8 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
