Abstracts

Gel filtration packing is a material used to separate and purify molecular mixtures and is commonly used in biochemistry, molecular biology, and drug development. The core principle is based on molecular size exclusion, which allows molecules to be separated according to size through the porous structure within the filler. Larger molecules cannot enter the pores and flow out first along a shorter path outside the filler, while smaller molecules enter the pores, prolonging their residence time and ultimately achieving separation.

The global Gel Filtration Packing market size was estimated at USD 509.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.
