## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Gelatin-Based Bioink competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Gelatin-based bioink refers to a class of hydrogel biomaterials derived from gelatin (a denatured form of collagen) and often chemically modified (for example methacrylation to form GelMA) so that it can support 3D bioprinting of living cells and tissues by providing an extracellular-matrix-like, cell-friendly environment. In the industry chain, upstream inputs include raw materials such as animal- or marine-derived collagen/gelatin, chemical reagents for modification (e.g., methacrylic anhydride), photoinitiators, sterile cell culture media, and manufacturing infrastructure (cleanrooms, formulation equipment, lyophilisation). Midstream is the bioink production: formulation of gelatin/modified gelatin hydrogel, sterilisation, packaging into vials or cartridges, quality control (sterility, endotoxin levels, viscosity, rheology). Downstream applications include 3D bioprinting for tissue engineering, organ-on-chip models, drug screening, regenerative medicine implants and contract research organisation (CRO) services. In 2024, global Gelatin-based bioink sales volume reached approximately 0.78 million units, with an average global market price of around 130.5 US\$ per unit.

The global Gelatin-Based Bioink market size was estimated at USD 103.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 20.70% during the forecast period.
