Abstracts

Gelatin methacryloyl is a photosensitive biomaterial with good biocompatibility and cell adhesion. Gelma is a derivative obtained by introducing methacrylate groups into gelatin molecules. Gelatin itself is a natural polymer material, mainly formed by the hydrolysis of collagen, and has good biocompatibility and degradability. Gelma inherits these excellent properties of gelatin, and has photosensitivity due to the introduction of methacrylate groups. It can be combined with photoinitiators and cured under blue light or ultraviolet light. This makes gelma have broad application prospects in the biomedical field, such as for the preparation of injectable hydrogels, tissue engineering scaffolds, drug sustained-release carriers, etc. In addition, the photosensitivity of gelma also makes it have potential application value in 3D printing technology.

The global Gelatin Methacrylate market size was estimated at USD 671.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
