Abstracts

Gene therapy is the therapeutic delivery of nucleic acid into a patient's cells as a drug to treat disease. Research in gene therapy for cancer is currently focused in multiple areas, including genetically engineered viruses that directly kill cancer cells, gene transfer to alter the abnormal functioning of cancer cells, and immunotherapy (which includes CAR T-cell therapy), which helps the immune system better find and kill. The gene therapies for tumor treatment market is driven by the growing need for targeted and personalized cancer therapies and the increasing focus on innovative treatment approaches. Gene therapies involve the introduction of therapeutic genes into cancer cells to target and destroy tumors or inhibit their growth. The rise in the incidence of cancer and the limitations of conventional cancer treatments contribute to market growth. Moreover, advancements in gene editing technology and the understanding of tumor genetics have improved the development of effective gene therapies. However, the market also faces challenges, including the complexity of tumor heterogeneity and the potential for off-target effects in gene editing. Additionally, addressing regulatory and ethical considerations and ensuring accessibility and affordability can pose obstacles for widespread adoption. To succeed, companies must focus on research and development to offer safe and efficient gene therapies, collaborate with oncology centers to conduct clinical trials and address specific tumor types, and address the challenges to meet the increasing demand for effective and transformative cancer treatments.

The global Gene Therapies for Tumor Treatment market size was estimated at USD 7976.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 20.10% during the forecast period.
