Abstracts

Gene therapy in oncology represents a cutting-edge therapeutic approach that involves the introduction, alteration, or regulation of genetic material within a patient's cells to treat or prevent cancer, utilizing techniques such as viral vectors (e.g., lentiviruses or adeno-associated viruses) to deliver therapeutic genes such as tumor suppressor genes, immune-stimulating genes, or gene-editing components like CRISPR-Cas9 directly into target cells, with the goal of correcting genetic mutations, enhancing the immune system's ability to recognize and destroy cancer cells (as in CAR-T cell therapies), or inducing apoptosis in malignant cells, thereby offering a highly personalized and potentially curative treatment modality that differs fundamentally from traditional chemotherapy, radiation, or small-molecule inhibitors by targeting the underlying genetic drivers of cancer.
