Abstracts

General anesthesia medicine refers to a class of pharmaceutical agents used to induce a reversible state of unconsciousness, amnesia, analgesia, and muscle relaxation, enabling patients to undergo surgical or diagnostic procedures without pain, awareness, or movement. These drugs are administered via inhalation (volatile anesthetics like sevoflurane or desflurane) or intravenously (such as propofol, etomidate, or barbiturates), often in combination with adjuncts like opioids and neuromuscular blocking agents to achieve balanced anesthesia. The mechanism of action involves modulating neurotransmitter systems?primarily enhancing inhibitory GABAergic transmission or inhibiting excitatory NMDA receptors?resulting in central nervous system depression. Their use requires precise dosing and continuous monitoring by anesthesiologists due to narrow therapeutic indices and potential side effects, including hemodynamic instability, respiratory depression, and rare complications like malignant hyperthermia. Advancements focus on improving safety profiles, rapid onset/offset kinetics, and reduced postoperative cognitive effects.

The global General Anesthesia Medicine market size was estimated at USD 4568.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.15% during the forecast period.
