Abstracts

A general rectifier diode is a fundamental semiconductor device that allows electric current to flow predominantly in one direction, thereby converting alternating current (AC) to direct current (DC) in electronic circuits. It operates based on a p-n junction, where the p-side (anode) and n-side (cathode) create a barrier that permits forward-biased current flow while blocking reverse-biased current, making it indispensable for power supply units, voltage regulation, signal demodulation, and protection against reverse polarity. Characterized by parameters such as peak inverse voltage (PIV), forward voltage drop, maximum average forward current, and switching speed, these diodes are broadly categorized into standard recovery, fast recovery, and Schottky types, each tailored to specific efficiency and frequency requirements across consumer electronics, industrial machinery, automotive systems, and renewable energy applications.

The global General Rectifier Diode market size was estimated at USD 1200.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
