Report Overview:

In an electric power system, Generator Control Unit is a system for adjusting the power output of multiple generators at different power plants, in response to changes in the load. Since a power grid requires that generation and load closely balance moment by moment, frequent adjustments to the output of generators are necessary. The balance can be judged by measuring the system frequency; if it is increasing, more power is being generated than used, which causes all the machines in the system to accelerate. If the system frequency is decreasing, more load is on the system than the instantaneous generation can provide, which causes all generators to slow down.

The Global Generator Control Unit Market Size was estimated at USD 560.02 million in 2023 and is projected to reach USD 754.78 million by 2029, exhibiting a CAGR of 5.10% during the forecast period.
