## Abstracts

Geometric optical waveguides are dominated by array optical waveguides, with excellent imaging effects. Two-dimensional pupil expansion solves the contradiction between the optical machine volume and the field of view and EyeBox. In addition to the advantages of lightness and thinness common to optical waveguides, geometric array optical waveguides have better imaging effects (less stray light/uniform color/larger EyeBox & field of view/high resolution) compared to the mass-produced surface relief grating diffraction optical waveguides, with almost no light leakage problems (1%-5%), and low light loss, which can reduce the power consumption of the optical machine and increase battery life.

The global Geometric Array Waveguides market size was estimated at USD 206.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.00% during the forecast period.
