Abstracts

Germanium infrared lenses are optical components specifically engineered for the transmission of infrared (IR) light, primarily within the mid-wave (MWIR) and long-wave (LWIR) infrared spectra, typically between 2-14 micrometers. These lenses are fabricated from high-purity germanium, a semiconductor material valued for its high refractive index, low chromatic aberration, and exceptional transmittance in IR wavelengths, though it is opaque to visible light. Due to germanium's inherent brittleness and sensitivity to temperature variations, these lenses are often coated with durable anti-reflective and protective layers to enhance performance, reduce surface reflection, and improve resistance to environmental factors such as humidity and abrasion. Key applications include thermal imaging systems, military and defense targeting, surveillance equipment, industrial process monitoring, automotive night vision, scientific instrumentation, and medical diagnostics, where precise IR imaging is critical.

The global Germanium Infrared Lens market size was estimated at USD 78.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
