Report Overview

The GFCI (Ground Fault Circuit Interrupter) controller is an electrical safety device designed to protect against electric shock by detecting ground faults?instances where electrical current unintentionally flows outside the intended path, such as through a person or water. It works by continuously monitoring the current balance between the hot and neutral wires; if an imbalance exceeding a threshold (typically 4?6 milliamps) is detected, the GFCI controller rapidly interrupts the circuit, cutting off power in milliseconds to prevent injury or fire hazards. These devices are commonly integrated into outlets, circuit breakers, or portable adapters and are widely mandated in residential, commercial, and industrial settings, particularly in areas with high moisture exposure like kitchens, bathrooms, and outdoor spaces. Their critical role in electrical safety has driven steady demand, supported by stringent building codes and increasing awareness of electrical hazard prevention.
