Report Overview

A passive optical network (PON) is a telecommunications technology used to provide fiber to the end consumer, both domestic and commercial. A PON's distinguishing feature is that it implements a point-to-multipoint architecture, in which unpowered fiber optic splitters are used to enable a single optical fiber to serve multiple end-points. The end-points are often individual customers, rather than commercial. A PON does not have to provision individual fibers between the hub and customer. Passive optical networks are often referred to as the 'last mile' between an ISP and customer.

The increasing demand for energy conservation and strong optical network setup is expected to fuel the market growth. Emerging regional markets, such as Asia Pacific, offer strong growth opportunities for the technology owing to intensive bandwidth applications.
