Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Gigabit Wireless Router competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global sales of gigabit wireless routers reached 56.24 million units, with an average selling price of \$33.52 per unit. A "gigabit wireless router" typically refers to a home or enterprise-grade router with a theoretical wireless speed of >1000 Mbps and wired WAN/LAN ports both at 1000 Mbps. It must not only meet gigabit-level wireless standards such as 802.11ac/ax/be, but also possess a gigabit switching chip; otherwise, it can only be considered "wireless gigabit" rather than "true gigabit." The main raw materials for gigabit wireless routers are chips (main control SoC, Wi-Fi baseband and RF, Ethernet PHY), PCB boards, memory and flash memory, plastic or metal casing, power adapter, and passive components. Chips alone account for approximately 40% of the raw material cost, and overall, direct materials account for over 80% of the factory cost. The cost structure is highly characterized by "material-heavy, labor-light": raw materials account for approximately 80%-90%, direct labor 5%-10%, and manufacturing costs 3%-7%. Therefore, price fluctuations in core chips, memory, and high-end PCBs have the greatest impact on profits.

The global Gigabit Wireless Router market size was estimated at USD 1885.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.30% during the forecast period.
