Abstracts

Gingival retraction kits are specialized dental devices used primarily during crown and bridge procedures to temporarily displace gingival tissue and control sulcular fluid, thereby creating adequate space and a dry field for accurate impression-taking. These kits typically include retraction cords of various sizes and materials, along with accompanying instruments such as cord packers and hemostatic agents, which may be chemically impregnated or applied separately to aid in tissue displacement and bleeding control. The primary objective is to ensure precise marginal fit of final restorations by facilitating clear visualization and capture of the prepared tooth's finish line, making them an essential component in restorative and prosthetic dentistry.
