### Report Overview

Glass bead filler materials are particles added to resins or binders that can improve specific properties and make products cheaper. Most glass fillers are short strands of glass fibers; however, increasing numbers of long strand grades are also available. Long strand versions can provide greater strength than the more traditional short strand varieties. The design has a key impact on the final strength, as orientation of the fibers is affected by the flow of the material. The injection molding process may or may not break some of the fibers, particularly in the case of long strands.
