Abstracts

Glass fiber for wind power refers to specialized glass-reinforced plastic (GRP) materials, primarily composed of continuous glass filaments embedded in a polymer matrix (typically epoxy or polyester resin), engineered to offer high tensile strength, fatigue resistance, and lightweight properties essential for manufacturing wind turbine blades. These materials are critical structural components in both onshore and offshore wind energy systems, where they enable the production of longer, more efficient blades that capture greater wind energy while withstanding harsh environmental conditions, such as extreme temperatures, moisture, and cyclic mechanical loads. The product is often optimized through specific formulations, including the use of E-glass or higher-performance variants, and may incorporate additives or coatings to enhance durability, stiffness, and resistance to erosion, aligning with the stringent demands of the renewable energy sector for reliability, cost-effectiveness, and sustainability over decades of operation.

The global Glass Fiber For Wind Power market size was estimated at USD 4250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
