Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Glass Flake competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Glass flakes are flat glass fragments approximately 5 microns thick. They are typically made from molten medium-alkali glass at high temperatures (approximately 1200°C) through a process of blowing, cooling, crushing, screening, and grinding. Their structure is characterized by high-aspect-ratio flakes arranged in a dense, overlapping "palace-like" structure within the resin, significantly enhancing impermeability and corrosion resistance. Glass flakes are widely used as fillers in anti-corrosion coatings, offering excellent chemical, heat, abrasion, and aging resistance. Compared to traditional fillers such as mica and calcium silicate, glass flakes significantly extend the penetration path of corrosive media in coatings, thereby enhancing the coating's protective properties and making it particularly suitable for long-term protection in harsh environments. Glass flake coatings typically have a gross profit margin of 35%–55%, demonstrating strong profitability. The raw material price of glass flakes is approximately US\$3.8 per kilogram, and the typical addition ratio to coatings is 10%–30%, varying depending on the formulation and performance requirements. The annual production capacity of a single production line in the industry generally ranges from 12 million to 30 million square meters. This capacity is significantly influenced by coating methods and film thickness control, demonstrating high-scale manufacturing capabilities and technological flexibility. The glass flake market is at a critical stage of structural upgrades and performance leaps. The upstream supply chain primarily relies on medium-alkali glass, alkali-free glass, epoxy and vinyl ester resin systems, and various additives, with fine chemical and glass material companies forming the core supply chain. The downstream sector encompasses industries such as oil and gas, offshore engineering,

chemical equipment, and infrastructure, which require extremely high long-term corrosion protection. Steel structures and concrete components are the primary substrates used. Future development trends will focus on high-performance composite systems (such as glass flake + ceramic powder + nanofiller), alternative applications of environmentally friendly low-VOC coatings, and accelerated domestic substitution, particularly in the offshore engineering and infrastructure sectors. At the same time, technological innovation is driving flake size control and optimized dispersion, significantly improving coating density and protective performance.

The global Glass Flake market size was estimated at USD 508.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
