Abstracts

Glass Free 3D, also known as autostereoscopic 3D, refers to display technologies that create a three-dimensional visual experience without requiring viewers to wear special glasses or headgear. This is achieved through various methods such as lenticular lenses, parallax barriers, or volumetric displays, which direct different images to each eye to simulate depth perception. Unlike traditional stereoscopic 3D, which relies on external aids like polarized or active-shutter glasses, glass-free 3D offers a more accessible and seamless viewing experience, making it suitable for applications ranging from consumer electronics and digital signage to medical imaging and automotive displays. The technology aims to eliminate viewer discomfort and logistical barriers associated with glasses while enhancing immersion and usability in both personal and public settings.

The global Glass Free 3D Technology market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
