Abstracts

Glass glaze fixed resistors are passive electronic components designed to provide a stable and precise level of electrical resistance in circuits, constructed by applying a resistive glaze—typically composed of metal oxides or glass frit—onto a ceramic substrate, which is then fired at high temperatures to form a durable, insulating layer that is subsequently trimmed to achieve the desired resistance value and coated for environmental protection. These resistors are characterized by their high reliability, excellent temperature stability, low noise, and strong performance under high-voltage conditions, making them suitable for demanding applications in industrial equipment, automotive electronics, medical devices, telecommunications infrastructure, and precision instrumentation where long-term accuracy and minimal drift are critical.

The global Glass Glaze Fixed Resistor market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
