Abstracts

Glass Ionomer Luting Cement is a water-based dental cement specifically designed for the permanent or long-term cementation of indirect restorations and orthodontic appliances, based on the classic glass ionomer acid–base reaction. It is generally supplied as a fluoroaluminosilicate glass powder and an aqueous solution of polyalkenoic acids (such as polyacrylic acid). When mixed, the polyacid attacks the glass particles, releasing calcium, aluminum and fluoride ions, which crosslink the polymer chains to form a rigid polysalt matrix that chemically adheres to enamel and dentin. Because of this chemical bonding, Glass Ionomer Luting Cement provides reliable retention without the need for complex adhesive systems and shows a film thickness thin enough for accurate seating of crowns, bridges, inlays, onlays, posts and orthodontic bands. A key feature is sustained fluoride release and partial recharge, which contributes to secondary caries prevention at the restoration margins.

The global Glass Ionomer Luting Cement market size was estimated at USD 262.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.10% during the forecast period.
