Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Glass NTC Thermistor competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Glass NTC Thermistor is a heat-sensitive semiconductor resistor, which is composed of polycrystalline ceramics of mixed oxides. Its resistance value decreases with the increase of temperature, and the temperature coefficient of resistance is $-2\%/k \sim -6\%/k$ in the range, roughly 10 times the temperature coefficient of metal resistance. The change of the resistance value of the NTC thermistor can be caused by the change of the external environment temperature, or it can be caused by the current flowing and self-heating. Its various uses are based on this characteristic. The Glass NTC Thermistor market is experiencing steady growth driven by increasing demand for high-precision temperature sensing in a range of industrial, automotive, and consumer electronics applications. Glass-encapsulated NTC (Negative Temperature Coefficient) thermistors offer superior stability, reliability, and resistance to harsh environments, making them ideal for use in extreme temperature and moisture conditions. Advancements in electronics miniaturization and the rising need for energy-efficient thermal management solutions are further fueling market expansion. Key players in the industry are focusing on innovation and strategic partnerships to meet the evolving needs of sectors such as electric vehicles, medical devices, and smart home technologies.

The global Glass NTC Thermistor market size was estimated at USD 58.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.20% during the forecast period.
