Abstracts

A glass passivated diode is a semiconductor device that utilizes a glass passivation layer to protect the p-n junction from environmental contaminants, moisture, and mechanical damage, thereby enhancing its reliability, stability, and long-term performance in various electronic applications. This type of diode is characterized by its hermetic sealing properties, which prevent oxidation and degradation of the semiconductor surface, resulting in improved electrical characteristics such as lower leakage currents, higher breakdown voltages, and greater temperature stability compared to non-passivated or plastic-encapsulated alternatives. Commonly used in power supplies, rectifiers, voltage regulators, and automotive electronics, glass passivated diodes are valued for their durability in harsh operating conditions and their ability to maintain consistent performance over extended periods.

The global Glass Passivated Diode market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
