Report Overview

A glass substrate for semiconductor packaging refers to a specially designed glass material used as a base or platform for constructing and assembling electronic components, particularly semiconductors. It provides a stable and inert surface for mounting and connecting delicate semiconductor devices, such as integrated circuits (ICs), microprocessors, and memory chips. Glass substrates used in semiconductor packaging are engineered to possess specific characteristics that make them suitable for this application. These characteristics include high thermal conductivity, low coefficient of thermal expansion (CTE), electrical insulation properties, chemical resistance, and excellent dimensional stability. The glass substrate serves as a foundation for placing and interconnecting chips, allowing for the creation of complex electronic circuits. Additionally, it can provide protection against moisture, dust, and mechanical stress, enhancing the durability and reliability of the semiconductors. Compared to currently used organic substrates, glass substrates offer better thermal and mechanical stability and ultra-low flatness. These properties promote the increase in chip surface area and the number of chiplets on a single package. A dynamic that allows, in short, to improve the design rules necessary for artificial intelligence products and future data centers by an order of magnitude.

The global Glass Substrate for Semiconductor Packaging market size was estimated at USD 180 million in 2023 and is projected to reach USD 668.76 million by 2032, exhibiting a CAGR of 15.70% during the forecast period.

North America Glass Substrate for Semiconductor Packaging market size was estimated at USD 60.38 million in 2023, at a CAGR of 13.46% during the forecast
