## Abstracts

Glass Substrate TGV stands for Through-Glass Vias. It refers to microscopic holes or channels etched or drilled through a glass substrate, typically used in advanced packaging for microelectronics. These vias are then filled with conductive materials like copper or other metals to create vertical electrical interconnections between different layers of a device. TGV technology enables higher density interconnects, improved signal integrity, and miniaturization of electronic devices, particularly in applications like 3D packaging and high-frequency electronics. Glass Substrate TGV is a critical segment in the semiconductor packaging and microelectromechanical systems (MEMS) fields. Its primary function is to create microscopic vias in glass substrates and metallize them to enable three-dimensional interconnections for chip packaging, sensors, or optoelectronic devices. The upstream sector is dominated by high-quality glass substrate suppliers, with relatively concentrated raw material supply; however, demand for specialty glass is growing rapidly, and some high-end materials face supply constraints. The midstream consists of TGV foundries, typically operating in single-line production modes, with each production line capable of producing several thousand to tens of thousands of wafers per month. Capacity expansion is limited by equipment investment and process maturity. The industry enjoys relatively high gross margins, usually around 30%?35%, but the cost structure is heavily weighted toward raw materials and key equipment depreciation, accounting for approximately 80%, making process optimization and yield improvement essential for cost control. From a policy perspective, governments encourage semiconductor self-sufficiency, supporting domestic TGV foundries, especially as demand remains stable in consumer electronics, optical communications, automotive electronics, and aerospace applications. Downstream, TGV is mainly consumed by applications such as optoelectronic sensors, micro-LED displays, and RF packaging, with consumption closely tied to end-product output and packaging complexity. Looking ahead, high-density, high-reliability, and multi-

layer TGVs are expected to become mainstream, while advanced packaging and heterogeneous integration drive TGV technology upgrades. Domestic and international foundries are accelerating production line expansion and yield optimization to meet emerging application demands.

The global Glass Substrate TGV market size was estimated at USD 941.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.20% during the forecast period.
