Abstracts

Glass wool and rock wool are two types of mineral wool insulation materials derived from inorganic raw materials, primarily used for thermal, acoustic, and fire-resistant applications in construction and industrial settings. Glass wool is manufactured from recycled glass and sand melted at high temperatures and spun into fine fibers, resulting in a lightweight, flexible material ideal for insulating walls, ceilings, and HVAC systems. Rock wool, also known as stone wool, is produced by melting volcanic rock (such as basalt) or slag, then spinning it into dense, rigid, or semi-rigid boards and batts that offer superior fire resistance, moisture repellency, and compressive strength, making it suitable for high-temperature industrial applications, external wall insulation, and fireproofing. Both materials are valued for their sustainability, non-combustibility, and energy efficiency properties, though they differ in raw material composition, density, and specific performance characteristics, with rock wool generally providing higher thermal stability and sound absorption in demanding environments.

The global Glass Wool And Rock Wool market size was estimated at USD 15000.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
